2) If possible use “,” (comma) as separator instead of “;” (comma)

3) I need the output is exactly in the same order of the the page we scrape . That s why by the commercial point of view being first it s important and I want to get t.

Is it possible to add a progressive equal to the order of the single offer/hotel at the beginning of the record adding a “first” column? The progressive refers to the whole query. I mean : if I need to scrape trivago for Rome 3 and 4 stars hotel I will create two different input file (like POportal) and for each input file every single record has a progressive number 1- “n” equal to the position in the page for that specific query
